

Thank you for enrolling in the course and keeping all GNU Radio Companion (GRC) files offline, **as they are for your private use**.

Below are some infrequently asked questions I have received from the learners.

Q. The provided GNU Radio Companion (GRC) flowgraphs are not working on my computer.

A. Most of the flowgraphs work with GNU Radio version 3.8 or higher. These flowgraphs have been verified by lots of users on different computers and installations and therefore are working correctly. However, like all other open-source software, sometimes GNU Radio also poses problems and if you receive an error, please try to debug it at GNU Radio end or ask a question on their email list.

Q. In some GRC flowgraphs, a custom block is shown as missing, see the figure below.

A. Let us solve it through the example shown in the figure. In the GRC files of Module 3, you would see a block named qTx_QAM_Passband.grc. Open that file and click on Run button to execute the flowgraph. Now click on **Reload** or **Refresh** button (one or two circular arrows) which is towards the right side of the top toolbar. This block will then be shown as a valid block in your flowgraph (since it is now present in your Block Tree Panel under qBlocks). After this procedure, **please remember to update the parameter values in this block correctly!** (i.e., according to the parameter values in your existing flowgraph).
